

Given:

Req'd ω_{BC}

Assump: I don't know huthin!

Strategy lot of instantaneous centers & math!

Estimate I have a very fuzzy sense that because
 $AB \sim CD$ that the arc BC is rotating
 maybe about $\frac{1}{2}$ as much so 2.5 rad/s ??

Soln:

$$v_{B/O} = \omega_{AB} r_{AB} \quad r_{AB} = \sqrt{0.2^2 + 0.4^2} = \sqrt{0.04 + 0.16} = 0.447 \text{ m}$$

$$v_{B/O} = 5 \text{ rad/s} \cdot 0.447 \text{ m}$$

$$v_{B/O} = 2.236 \text{ m/s}$$

Soln cont: Examining the previous drawing

$$\frac{x}{x+0.6\text{m}} = \frac{0.2\text{m}}{0.4\text{m}} = \frac{1}{2} \quad (\text{similar } \Delta's)$$

$$\Rightarrow 2x = x + 0.6\text{m} \Rightarrow \underline{\underline{x = 0.6\text{m}}}$$

$$\Rightarrow r_1 = \sqrt{1.2^2 + 0.6^2} = \sqrt{1.44 + 0.36} \text{ m} = \sqrt{1.8} = \underline{\underline{1.342\text{m}}}$$

$$V_{B/O} = \omega_{BC} r_{B/\text{center}} \Rightarrow 2.236\text{m/s} = \omega_{BC} 1.342\text{m}$$

$$\Rightarrow \omega_{BC} = \frac{2.236\text{m/s}}{1.342\text{m}} = \underline{\underline{1.67\text{rad/s}}} \quad \begin{array}{l} \nwarrow \text{also} \\ \text{since } V_C \text{ 'steeper' } \\ \text{than } V_B \end{array}$$

Discussion: Interesting. Not sure how I feel about this as a 'special' technique but every Dynamics course discusses it at some level.
